

Three preregistered external families separate skill efficacy from routing quality

Rhobox: harmful transfer correctly rejected. IRED: useful LLM skill deployed. TrpB: useful skill missed by the gate.

A. Candidate efficacy and complete-router outcome

B. What the frozen router did

Rhobox **HOLD** | **Correct reject**

Prospective safety

IRED **TRANSFER** | **Correct deploy**

Prospective efficacy

TrpB **HOLD** | **False-negative hold**

Prospective efficacy + attribution

Lesson: routing must condition on deployment support, not only on a low-overlap calibration replay.

100 paired deployment seeds per family. IRED uses its preregistered bootstrap CI; Rhobox and TrpB use paired normal CIs. Descriptive only; n=3 is not a population estimate.
